The XML format of the PDI is similar to the Access format. In this example export, the XML file begins with a list of all of the tables in the PDI export file with the columns for each table.

```xml
<s:choice minOccurs="0" maxOccurs="unbounded">
<xs:element name="exp_adap_enrollment_history">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="adp_en_hs_pk" type="xs:string" minOccurs="0" />
      <xs:element name="adp_en_hs_cln_fk" type="xs:string" minOccurs="0" />
      <xs:element name="adp_en_hs_date" type="xs:dateTime" minOccurs="0" />
      <xs:element name="adp_en_hs_status_code" type="xs:string" minOccurs="0" />
      <xs:element name="adp_en_hs_status_label" type="xs:string" minOccurs="0" />

<xs:element name="exp_annual_review">
  <xs:complexType>

      <xs:element name="ann_rv_pk" type="xs:string" minOccurs="0" />

After the tables and columns section, client records are listed starting with exp_annual_review.

```xml

After the client's exp_annual_review and exp_client table records, county reference files are listed.

```xml
<exp_county_rft>

</exp_map_client_provider>
<exp_ownership_status_rft>
```

Next is ownership and provider data.

```xml
<exp_ownership_status_rft>

Then exp_service records.

```xml
<exp_provider_type_rft>

   <stt_abbreviation>AZ</stt_abbreviation>
</exp_state_rft>
            -
```

Then exp_version history table fields. The version history describes changes to the PDI template by CAREWare build number.

```xml
<exp_state_rft>

Then metadata tables are listed.

In these examples, each client record starts with the table name followed by the records for each column in that table. Boolean records are listed as True or False. Pk and fk records are populated by a guid produced by CAREWare. When creating an import, the pk and fk fields can be created by the user matching them on the appropriate table. Please refer to the PDI Specifications document for instructions on populating client data for an import file.
